For this assignment, the two model classes that will be persisted between application runs are *Task.java* and *TaskList.java* in the future I would like all classes to be persisted as they will be connected. TaskStack, being a task tracking app with different aspects in it as well as a calendar view, notes list, and more, means that all information the user puts in would need to be persisted so that all their tasks are always there. Otherwise, the app is completely useless. So, for this assignment I will start by making Task and TaskList persist data so that the tasks inputted stay in their list and can be re-accessed anytime the app is closed and reopened.

PersistenceCntl.java will be the controller class for my application that will be managing persistence for all model classes. For this project it will only be managing persistence for *Task.java* and *TaskList.java* but moving forward will also manage persistence for data within *Calander.java*, *Category.java*, *Note.java*, and *Layout.java* as well. This way the app will fully remember everything the user had set and inputted prior to be re-accessed at anytime on open.

The user will be able to accomplish this by viewing their Tasks and Task List within the Task and Task List UIs. Instead of having to reinput new tasks every time they can now input it once and view it whenever in the future. *TaskTableModel.java* helps to then turn the persisted Task List to be viewable inside of the Task List UI.
